We Detect What You Suspect!!Your home is your sanctuary. It's a place you love. A place that makes you feel good but contaminated air can be hazardous to your health and cause uncomfortable symptoms.IET specializes in health factors, catering to the chemically-sensitive, mold-sensitive, electro-sensitive and allergy-prone population. With state-of-the-art instrumentation and the latest lab analyses, we can identify pollutants in the home that are likely to affect health.Mold testing offers a wide variety of mold testing from ERMI to Mycotoxins to full mold inspections including wall and ceiling cavities, furniture, mattresses, carpeting, ice dispensers, drip pans, heating and air conditioning (HVAC), C-Pap machines, etc.We also conduct electromagnetic field assessment. Electropollution can cause headaches, brain fog, irritability, insomnia, ringing in the ears, anxiety, depression, heart palpitations or skin rashes. An EMF survey measures the occupants exposure to radio frequencies including 5G, dirty electricity (stray voltage), magnetic fields and extremely low frequency (ELF). Recommendations are provided for mitigation, shielding and filtering of excessive fields.
